

A quick check-in for safer living at home.

Strength Assessment powered by Able Assess

MEASURES
STRENGTH
IN UNDER
5 MINUTES

Able Assess uses 1 sensor to measure grip strength, balance, leg strength, and gait speed to assess risk of falling.

Implementing these assessments can lead to a reduction in falls and decreased hospitalization rates.

“

It makes it so much easier to write goals and track progress over time. It gives us the objective data we need to feel confident in a care plan and working with home care partners to reduce falls.

— Physical Therapist, Clinical Director

At Griswold, we believe prevention is one of the most meaningful forms of care. That is why we have integrated Able Assess to offer a quick strength screening—a simple way to understand mobility factors that can influence fall risk.

Falls can change independence quickly. A brief screening can help identify areas to strengthen—so older adults can feel more confident moving through daily life.

Griswold is proud to partner with Able Care to offer an easy, objective screening that supports safer living at home.

How It Works

Screenings are guided by a trained Griswold team member using the GripAble device and simple movement checks.

We look at four key areas:

Grip Strength

A simple indicator associated with overall strength and resilience.

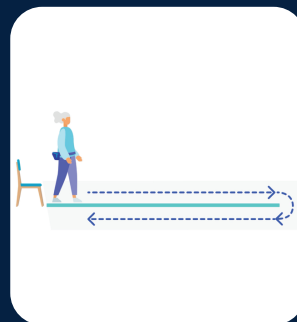

Chair Stand

Looks at lower-body strength—important for getting up safely and maintaining stability.

Timed Up & Go

Observes balance and mobility during an everyday “stand, walk, turn, sit” movement pattern.

Gait Speed

Measures walking pace, often linked with functional independence.

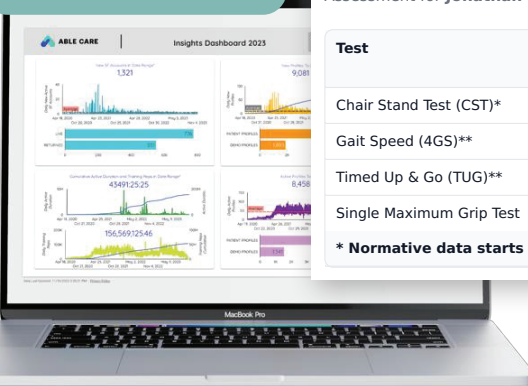

Data-Driven Results

Then, data is analyzed in the Able Assess app. Results provide a simple way to support prevention conversations and care planning by adding an objective screening touchpoint, providing a consistent baseline to track change over time, and supporting safer transitions.

EASY TO USE APP

DATA REPORTING

Falls risk profile

At risk of falls

Assessment for **Jonathan Doe**, age **101**, recorded on **Thursday, September 11, 2025**.

Test	Time	Result	Unit	Normative Range	Interpretation
Chair Stand Test (CST)*	18:36	6	reps	≥ 7	Below average
Gait Speed (4GS)**	18:37	51	m/s	≥ 0.8	Normal
Timed Up & Go (TUG)**	18:25	19	s	≤ 12	Below normal
Single Maximum Grip Test	18:38	104.9	lbs	≥ 26.2	High

* Normative data starts at 65. ** Normative data starts at 60.
